ABSTRACT:

Activation of plasminogen to plasma is inhibited by preventing the binding of a receptor binding form of urokinase-type plasminogen activator to a urokinase-type plasminogen activator receptor in a mammal, thereby preventing the urokinase-type plasminogen activator from converting plasminogen into plasmin. DNA fragments which encode for soluble, active fragments of the urokinase-type plasminogen activator are provided.

Horowitz; Bernard	New Rochelle	NY	N/A	N/A

US-CL-CURRENT: 424/176.1; 435/236, 514/8

ABSTRACT:

A mammalian blood protein-containing composition such as whole blood, plasma, serum, plasma concentrate, cryoprecipitate, cryosupernatant, plasma fractionation precipitate or plasma fractionation supernatant substantially free of hepatitis and other lipid coated viruses with the yield of protein activity to total protein being at least 80% is disclosed. The protein-containing composition is contacted with di- or trialkylphosphate, preferably a mixture of trialkylphosphate and detergent, usually followed by removal of the di- or trialkylphosphate.

435/173.3, 435/238

ABSTRACT:

A method is provided for inactivating viral and/or bacterial contamination in blood cellular matter, such as erythrocytes and platelets, or protein fractions. The cells or protein fractions are mixed with chemical sensitizers and irradiated with, for example, UV, visible, gamma or X-ray radiation. In particular, quaternary ammonium or phosphonium substituted, halo-psoralen compounds are described as being useful.

ABSTRACT:

The invention provides compositions having thrombolytic effects, and comprise plasmin and a plasminogen activator. Such compositions can be administered locally or systemically. The invention also provides simple and safe therapies for thrombotic states and prevention of such states.

435/372.3, 435/5, 435/69.3, 435/70.3

ABSTRACT:

The present invention is directed to extracorporeal cell systems infected with hepatitis C virus (HCV). The present invention also relates to products of such cell systems and their use as vaccines and in immunoassays. Methods whereby HCV-infected extracorporeal cell systems are constructed are included, and various immunoassays to detect HCV antibodies are also presented. The HCV-infected cell systems can be used to screen putative antiviral agents.

TITLE: Methods and kits using macrophage stimulating protein

DATE-ISSUED: December 9, 1997

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Avraham; Hava Karsenty	Brookline	MA	N/A	N/A
Godowski; Paul J.	Burlingame	CA	N/A	N/A

US-CL-CURRENT: 514/12; 530/351, 530/380

ABSTRACT:

The invention provides methods for stimulating megakaryocyte maturation and thrombocyte production using macrophage stimulating protein ("MSP"). In the methods, an effective amount of MSP can be administered in vivo, or alternatively, be used to stimulate maturation of megakaryocytes and produce thrombocytes in vitro. Methods for treating thrombocytopenia in a mammal with MSP are also provided. Kits and articles of manufacture which include MSP are further provided.

Platz; Matthew S.	Columbus	OH	N/A	N/A

US-CL-CURRENT: 435/2; 435/173.1, 435/173.3

ABSTRACT:

Viral, bacterial and parasitic contaminants in blood and cell culture containing compositions are inactivated by adding a photosensitizer and a blocking agent to the composition and irradiating the resulting mixture with electromagnetic radiation. Blocking agents reduce photolysis of the photosensitizer by mechanisms not involving the quenching of reactive oxygen species. The blocking agents reduce photolysis which occurs by ring opening. Preferred photosensitizers are quinoline or quinolone.

US-CL-CURRENT: 424/444; 435/384, 514/772.3, 514/774

ABSTRACT:

The present invention relates to the treatment of skin defect by organotypically cultured autologous keratinocytes isolated from the outer root sheath of hair follicles. Methods for primary as well as subsequent organotypic cultures (epidermal equivalents) in fully defined media eventually supplemented by autologous human serum and substances isolated from blood components, with minimal allogeneic biological supplements, are disclosed. Techniques to prepare epidermal equivalents for transplantation are included, as well as a method for the transport of the epidermal equivalents.
